

Market Research Analyst

Data processing, analysis, insight and visualisation

This is a take-home exercise built on a real, anonymised monthly brand tracker. It is designed to assess how you turn a raw survey dataset into a clean, analysis-ready file, a defensible set of findings, and a clear, decision-oriented story. There is no single correct answer. We are assessing judgement, rigour and communication as much as technical execution.

1. The dataset you will receive

File: Mobily_KSA_BrandTracker_2025_AssessmentDataset.sav (SPSS format).

It is twelve monthly waves of a consumer brand tracker for the mobile telecommunications market in Saudi Arabia, covering the 2025 calendar year. In summary:

- Roughly 3,200 respondent records and just over 800 variables.
- A competitive set of eight telecom brands, each measured on the same battery of questions. Brand identities are anonymised and appear as coded IDs. Treat them as Brand 1 to Brand 8.
- A standard brand funnel and equity battery per brand: awareness, familiarity, past usage, future consideration, perceived quality, trust and reputation, recommendation, retention, price perception, word of mouth, image attributes, sustainability and advertising recall, plus a set of derived scores.
- Respondent profiling: gender, age, nationality, region, household income, and category behaviour such as monthly mobile spend and decision-making role.

Note on the data: the file is supplied as received from fieldwork, with its real-world imperfections intact. Part of the test is to find and handle them. It carries SPSS variable and value labels, so you do not need a separate questionnaire to interpret it.

Confidentiality: the dataset is anonymised and contains no personal contact details. It remains commercially sensitive. Please do not share, publish or retain it beyond this exercise, and delete it once you have submitted.

3. The brief

Work to this single guiding question: ***how healthy is Brand 4 in the KSA mobile market, and where should it focus to grow?*** Treat Brand 4 as your client. Everything you produce should help that client decide where to act.

Task 1: Process and clean the data

Turn the raw file into an analysis-ready dataset and show your reasoning.

- Profile the file and identify the data quality issues you would expect a market research analyst to catch and resolve.
- Make and apply sensible cleaning decisions. Where a choice is a matter of judgement, state your reasoning rather than guessing silently.
- Keep a short cleaning log: the issues you found, what you did about each, and any you chose to leave and why.

Deliver: the cleaned dataset (any open format) and the cleaning log (one to two pages, or a well-commented script or notebook or code/syntax file).

Task 2: Analyse the data

Build the evidence base for the guiding question. We are looking for the right metrics, computed correctly, and a competitive read.

- Construct the core brand health view for Brand 4: the funnel from awareness through to usage, consideration, recommendation and retention, plus at least one equity or perception measure.
- Benchmark Brand 4 against the competitive set. Where does it lead, where does it lag, and by how much.
- Add any deeper cuts that you think matters, for example a demographic segment, a sub-market, or a trend across the year. Choose depth over breadth.

Deliver: your analysis outputs (tables, workings, code) in any format. We may review your method, so keep it legible.

Task 3: Generate insight and report

Translate the analysis into a short, decision-oriented PowerPoint for a senior client audience.

- Around ten to fifteen slides. Lead with the answer. Every slide should make a point, not just present a chart.
- Be explicit about the “so what”: what the finding means for Brand 4 and what it should consider doing.
- Use clean, well-labelled visuals with units and a clear takeaway. Show ranges or caveats where the data is thin.

Deliver: the deck as a .pptx (or PDF if you prefer).

If you want to show this skill, build an interactive dashboard of the headline metrics.

- Power BI, Tableau, Looker Studio, a Python or web app, or anything else. Tool is your choice.
- Aim for something a client could actually use, filterable by brand and other dimensions, with clear labelling.

Deliver: the dashboard file, a published link, or a short screen recording if it cannot be shared directly.

4. Time, tools and submission

Time	Take-home over five working days. Please do not over-engineer it.
Tools	Use whatever you work best in: SPSS, R, Python, Stata, Excel, or a mix. There are no restrictions. We are ideally looking for folks with capability in a statistical package. Not just excel.
Scoping	If you run short of time, prioritise. Note briefly what you would have done with more time. We value good judgement on what matters.
AI tools	You may use them, as you would on the job. Be ready to explain and stand behind every decision and number in a follow-up discussion. We may ask you to do some actions live and question you on your process without the use of AI tools at your assessment review.

Submit

A single zipped folder: cleaned data and log, analysis outputs, the deck, and the dashboard if attempted.

5. How we will assess your submission

We score against the weightings below. The strongest submissions are not the most elaborate; they are the ones that make the right calls, show their reasoning, and land a clear, honest story.

- **Cleaning:** did you find the real issues, handle them sensibly, and document the decisions.
- **Analysis:** correct metrics, sound method, a genuine competitive read, and one cut with real depth.
- **Insight and report :** answer-first, a clear “so what”, and clean visuals a client could act on.
- **Communication and rigour :** explicit assumptions, legible working, and sensible scoping to the time available.
- **Dashboard(optional):** a usable, well-built interactive view of the headline metrics.

Questions about the brief are welcome and will not count against you. Knowing what to ask is part of the role.
